

Our county needs a new ordinance mandating all cannabis growers must provide their own water with controlled irrigation and drainage. This can be done by collecting rainwater in water tanks. Water comes from the sky, not the ground. Intercept it! We are not growers but survive on collected rain water. We have at least 15-20K gallons stored year round. Rain water comes from our roof through gutters into tanks, then we pump it through the well filtration system that delivers delicious clean water to our home. We collect about 3000 gallons in one night of gentle, steady rain. Do the math! There's plenty of rain available, and for a small investment by growers our water table won't be drained. We also have a dedicated water tank with hookup for fires. No more diverting and stealing our underground water! BOS please pay attention!!!

Sincerely,
Joy Calonico
